#### **CHAPTER – 1**

#### PROBLEM STATEMENT

#### 1.1 Statement:

Consider a crane that moves along an one-dimensional track. It behaves as a frictionless cart with mass M actuated by an external force F that constitutes the input of the system. There are two loads suspended from cables attached to the crane. The loads have mass  $m_1$  and  $m_2$ , and the lengths of the cables are  $l_1$  and  $l_2$  respectively. The figure 1 in the next chapter depicts the crane and associated variables used throughout this project.

#### **1.2 Problem 1:**

Obtain the equations of motion for the system and the corresponding nonlinear state-space representation. This is addressed in the chapter 2 of this report.

#### **1.3 Problem 2:**

Obtain the linearized system around the equilibrium point specified by x=0 and  $\theta_1 = \theta_2 = 0$ . Write the state-space representation of the linearized system. This problem is solved in the Chapter 3.

#### **1.4 Problem 3:**

Obtain conditions on M,  $m_1$ ,  $m_2$ ,  $l_1$  and  $l_2$  which the linearized system is controllable. The condition is obtained in the Chapter 4 of this project report.

#### **1.5 Problem 4:**

Choose M = 1000 Kg,  $m_1 = m_2 = 100$ Kg,  $l_1 = 20m$ ,  $l_2 = 10m$ . Check that the system is controllable and obtain an LQR controller. Simulate the resulting response to initial conditions when the controller is applied to the linearized system and also to the original nonlinear system. Adjust the parameters of the LQR cost until you obtain a suitable response. Use Lyapunov's indirect method to certify stability (locally or globally) of the closed-loop system. Refer to the Chapter 5 of this report for code and the outputs.

#### **1.6 Problem 5:**

Suppose that you can select the following output vectors:

x(t),  $(\theta_1(t), \theta_2(t))$ ,  $(x(t), \theta_2(t))$  or  $(x(t), \theta_1(t), \theta_2(t))$ . Determine for which output vectors the linearized system is observable. The observability is checked using MATLAB and the code is attached in the Chapter 6.

#### **1.7 Problem 6:**

Obtain your "best" Luenberger observer for each one of the output vectors for which the system is observable and simulate its response to initial conditions and unit step input. The simulation should be done for the observer applied to both the linearized system and the original nonlinear system. This section is addressed in the Chapter 7.

#### **1.8 Problem 7:**

Design an output feedback controller for your choice of the "smallest" output vector. Use the LQG method and apply the resulting output feedback controller to the original nonlinear system. Obtain your best design and illustrate its performance in simulation. How would you reconfigure your controller to asymptotically track a constant reference on x? Will you design reject-constant force disturbances applied on the cart? The LQG controller is designed, and the state response is plotted using MATLAB. Refer to the Chapter 8 for simulation results are shown in the Chapter 8.

#### **CHAPTER 1**

#### **INTRODUCTION**

This project deals with formulation of dynamic equations for crane which suspends two loads, followed by linearizing a non-linear system and the design of LQR controller, Luenberger observer and LQG controller. Controllability, observability for this system is verified along with the simulation of suitable Luenberger observer. The dynamic equations are setup numerically and non-linear state space equation is formulated which is then linearized around an equilibrium point using MATLAB. The remaining problems have been solved using code in MATLAB. The given Crane and suspended loads are shown in figure below.

Figure 1 Inverted Dual Pendulum

#### **CHAPTER - 2**

# EQUATIONS FOR MOTION AND NON-LINEAR STATE SPACE REPRESENTATION

Let us consider, that the crane is aligned along x-axis and two loads are suspended below the crane having masses  $m_1$  and  $m_2$  and their cable lengths are  $l_1$  and  $l_2$  and force (F) acts on the crane. Parameters used for deriving dynamic equations are defined below:

 $m_1 = mass of load1$ 

 $m_2 = mass of load2$ 

M= mass of crane

g= acceleration due to gravity

 $l_1$ = length of cable 1

l<sub>2</sub>= length of cable 2

 $\theta_{1=}$  angle made by first load with vertical

 $\theta_{2=}$  angle made by second load with vertical

h<sub>1</sub>= Effective height of load1 from base of the crane

h<sub>2</sub>= Effective height of load2 from base of the crane

F= external force

Position of mass  $(m_1)$  in parametric form is given by:

$$r_1 = (x - l_1 \sin \theta_1, -l_1 \cos \theta_1) \tag{1}$$

$$r_1 = x - l_1 \sin\theta \,\,\hat{\imath} - l_1 \cos\theta_1 \,\,\hat{\jmath} \tag{2}$$

differentiating  $r_1$  with respect to time we get,

$$\frac{d}{dt}(r_1) = (\dot{x} - l_1 \cos\theta_1 \, \dot{\theta_1}) \, \hat{\imath} + (l_1 \sin\theta_1 \dot{\theta_1}) \, \hat{\jmath} \tag{3}$$

Let,

$$\frac{d}{dt}(r_1) = V_{1x} + V_{1y} \tag{4}$$

[where  $V_{1x} = \dot{x} - l_1 cos\theta_1 \dot{\theta_1}$  and  $V_{1y} = l_1 sin\theta_1 \dot{\theta_1}$ ]

Position of mass (m<sub>2</sub>) in parametric form is given by:

$$r_2 = (x - l_2 sin\theta_2, -l_1 cos\theta_2) \tag{5}$$

$$r_2 = (x - l_2 \sin \theta_2) \hat{\imath} - (l_1 \cos \theta_2) \hat{\jmath}$$
 (6)

Differentiating  $r_2$  with respect to time we get

$$\frac{d}{dt}(r_2) = (\dot{x} - l_2 c \cos\theta_2 \dot{\theta_2}) \hat{i} + (l_2 \sin\theta_2 \dot{\theta_2}) \hat{j}$$
(7)

$$\frac{d}{dt}(r_2) = V_{2x} + V_{2y} \tag{8}$$

[where  $V_{2x} = \dot{x} - l_2 cos\theta_2 \dot{\theta_2}$  and  $V_{2y} = l_2 sin\theta_2 \dot{\theta_2}$ ]

#### 2.1 Kinetic Energy of System(K) is calculated as follows:

Where M= mass of cart

 $m_1$ = mass of load 1

m<sub>2</sub>= mass of load 2

$$K = \frac{1}{2}M\dot{x}^2 + \frac{1}{2}m_1(\sqrt{V_{1x} + V_{1y}})^2 + \frac{1}{2}m_2(\sqrt{V_{2x} + V_{2y}})^2$$
(9)

$$K = \frac{1}{2}M\dot{x}^2 + \frac{1}{2}m_1(\dot{x} - l_1cos\theta_1\,\dot{\theta_1})^2 + \frac{1}{2}m_1(l_1sin\theta_1\dot{\theta_1})^2 + \frac{1}{2}m_2(\dot{x} - l_2cos\theta_2\,\dot{\theta_2})^2 + \frac{1}{2}m_2(l_2sin\theta_2\dot{\theta_2})^2$$

#### 2.2 Potential Energy of the system(P) is calculated as follows:

For mass  $m_1$ ,  $P_1 = m_1gh_1$ 

where  $m_1$ = mass of load 1

g= acceleration due to gravity

h<sub>1</sub>= Effective height of load1 from base of the cart

From figure [1] - 
$$h_1 = -l_1 cos \theta_1$$

$$P_1 = -m_1 g l_1 cos\theta_1 \tag{11}$$

similarly, for second load Potential energy is

$$P_2 = -m_2 g l_2 cos\theta_2 \tag{12}$$

Total Potential Energy of system  $P = P_1 + P_2$ 

$$P = -m_1 g l_1 \cos \theta_1 \pm m_2 g l_2 \cos \theta_2 \tag{13}$$

Lagrangian L is computed as = Kinetic Energy – Potential Energy

$$= K - P$$

$$\begin{split} \mathcal{L} &= \frac{1}{2} M \dot{x}^2 + \frac{1}{2} \; m_1 \big( \dot{x} - l_1 cos\theta_1 \; \dot{\theta_1} \big)^2 + \frac{1}{2} \; m_1 \big( l_1 sin\theta_1 \dot{\theta_1} \big)^2 + \frac{1}{2} \; m_2 \big( \dot{x} - l_2 cos\theta_2 \; \dot{\theta_2} \big)^2 + \frac{1}{2} \; m_2 \big( l_2 sin\theta_2 \dot{\theta_2} \big)^2 \\ &- \big( - m_1 g l_1 cos\theta_1 \pm m_2 g l_2 cos\theta_2 \big) \end{split}$$

Rearranging terms we get,

$$L = \frac{1}{2}M\dot{x}^{2} + \frac{1}{2}m_{1}(\dot{x} - l_{1}cos\theta_{1}\dot{\theta_{1}})^{2} + \frac{1}{2}m_{1}(l_{1}sin\theta_{1}\dot{\theta_{1}})^{2} + \frac{1}{2}m_{2}(\dot{x} - l_{2}cos\theta_{2}\dot{\theta_{2}})^{2} + \frac{1}{2}m_{2}(l_{2}sin\theta_{2}\dot{\theta_{2}})^{2} + m_{1}gl_{1}cos\theta_{1} + m_{2}gl_{2}cos\theta_{2})$$

$$(15)$$

From Lagrangian mechanics we can write for the system of crane:

$$\frac{d}{dt}\left(\frac{\partial L}{\partial \dot{x}}\right) - \frac{\partial L}{\partial x} = F \tag{16}$$

$$\frac{\partial L}{\partial x} = 0 \quad [since \ no \ x \ terms] \tag{17}$$

$$\frac{\partial L}{\partial \dot{x}} = M\dot{x} + m_1(\dot{x} - l_1 \cos\theta_1 \,\dot{\theta}_1) + m_2(\dot{x} - l_2 \cos\theta_2 \,\dot{\theta}_2) \tag{18}$$

Differentiating  $\frac{\partial L}{\partial \dot{x}}$  with respect to time we get,

$$\frac{d}{dt}\left(\frac{\partial L}{\partial \dot{x}}\right) = M\ddot{x} + m_1\left[\ddot{x} - l_1\left(\cos\theta_1\ \ddot{\theta_1} - \dot{\theta_1}^2\sin\theta_1\ \right)\right] + m_2\left[\ddot{x} - l_2\left(\cos\theta_2\ \ddot{\theta_2} - \dot{\theta_2}^2\sin\theta_2\right)\right]$$
(19)

Substituting equations (19) and (17) in equation (16) we get,

$$F = M\ddot{x} + m_{1}\ddot{x} + m_{2}\ddot{x} - m_{1}l_{1}cos\theta_{1} \, \dot{\theta}_{1}^{2} + m_{1}l_{1}\dot{\theta}_{1}^{2}sin\theta_{1} - m_{2}l_{2}cos\theta_{2} \, \dot{\theta}_{2}^{2} + m_{2}l_{2}\dot{\theta}_{2}^{2}sin\theta_{2} \qquad (20)$$

$$(M + m_{1} + m_{2})\ddot{x}$$

$$= F + m_{1}l_{1}cos\theta_{1} \, \ddot{\theta}_{1} - m_{1}l_{1}\dot{\theta}_{1}^{2}sin\theta_{1} + m_{2}l_{2}cos\theta_{2} \, \ddot{\theta}_{2}^{2} - m_{2}l_{2}\dot{\theta}_{2}^{2}sin\theta_{2} \qquad (21)$$

$$\ddot{x} = \frac{F + m_{1}l_{1}cos\theta_{1} \, \ddot{\theta}_{1} - m_{1}l_{1}\dot{\theta}_{1}^{2}sin\theta_{1} + m_{2}l_{2}cos\theta_{2} \, \ddot{\theta}_{2} - m_{2}l_{2}\dot{\theta}_{2}^{2}sin\theta_{2}}{(M + m_{1} + m_{2})} \qquad (22)$$

As we know,

$$L = \frac{1}{2}M\dot{x}^{2} + \frac{1}{2}m_{1}(\dot{x} - l_{1}cos\theta_{1}\dot{\theta}_{1})^{2} + \frac{1}{2}m_{1}(l_{1}sin\theta_{1}\dot{\theta}_{1})^{2} + \frac{1}{2}m_{2}(\dot{x} - l_{2}cos\theta_{2}\dot{\theta}_{2})^{2} + \frac{1}{2}m_{2}(l_{2}sin\theta_{2}\dot{\theta}_{2})^{2} + m_{1}gl_{1}cos\theta_{1} + m_{2}gl_{2}cos\theta_{2})$$
(23)

Writing Lagrangian equation for load 1,

$$\frac{d}{dt} \left( \frac{\partial L}{\partial \dot{\theta}_1} \right) - \frac{\partial L}{\partial \theta_1} = 0 \tag{24}$$

$$\frac{\partial L}{\partial \theta_1} = m_1 (\dot{x} - l_1 cos\theta_1 \,\dot{\theta_1}) (l_1 sin\theta_1 \dot{\theta_1}) + m_1 (l_1 sin\theta_1 \dot{\theta_1}) \, l_1 cos\theta_1 \,\dot{\theta_1}$$
$$- m_1 g l_1 sin\theta_1 \qquad (25)$$

$$\frac{\partial L}{\partial \theta_1} = m_1 \dot{x} \ l_1 sin\theta_1 \dot{\theta_1} - m_1 g l_1 sin\theta_1 \tag{26}$$

$$\frac{\partial L}{\partial \theta_1} = m_1 \, l_1 \sin \theta_1 \big[ \dot{x} \dot{\theta_1} - g \big] \tag{27}$$

$$\frac{\partial L}{\partial \dot{\theta}_1} = m_1(\dot{x} - l_1 \cos\theta_1 \,\dot{\theta}_1)(-l_1 \cos\theta_1) + m_1(l_1 \sin\theta_1 \dot{\theta}_1)(l_1 \sin\theta_1) \tag{28}$$

$$\frac{\partial L}{\partial \dot{\theta}_1} = -m_1 \dot{x} l_1 \cos \theta_1 + m_1 l_1^2 \dot{\theta}_1 \tag{29}$$

$$\frac{d}{dt} \left( \frac{\partial L}{\partial \dot{\theta}_1} \right) = -m_1 \ddot{x} l_1 \cos \theta_1 + m_1 \dot{x} l_1 \sin \theta_1 \, \dot{\theta}_1 + m_1 l_1^2 \ddot{\theta}_1 \tag{30}$$

Substituting (27) and (30) in equation in (24), we get

$$\frac{d}{dt}\left(\frac{\partial L}{\partial \dot{\theta}_1}\right) - \frac{\partial L}{\partial \theta_1} = -m_1 \ddot{x} l_1 \cos \theta_1 + m_1 \dot{x} l_1 \sin \theta_1 \,\dot{\theta}_1 + m_1 l_1^2 \ddot{\theta}_1 - \left(m_1 \,l_1 \sin \theta_1 \big[\dot{x} \dot{\theta}_1 - g\big]\right) \tag{31}$$

Up on simplifying we get,

$$\ddot{\theta_1} = \frac{\ddot{x}cos\theta_1 - gsin\theta_1}{l_1} \tag{32}$$

Similarly, we get

$$\frac{d}{dt} \left( \frac{\partial L}{\partial \dot{\theta}_2} \right) - \frac{\partial L}{\partial \theta_2} = 0 \tag{33}$$

$$\ddot{\theta_2} = \frac{\ddot{x}cos\theta_2 - gsin\theta_2}{l_2} \tag{34}$$

Substituting (32) and (34) in (22), we get

Equation (22) is:

$$\ddot{x} = \frac{F + m_1 l_1 \cos \theta_1 \, \ddot{\theta_1} - m_1 l_1 \dot{\theta_1}^2 \sin \theta_1 + m_2 l_2 \cos \theta_2 \, \ddot{\theta_2} - m_2 l_2 \dot{\theta_2}^2 \sin \theta_2}{(M + m_1 + m_2)} \tag{22}$$

$$\ddot{x} = \frac{F + m_1 cos\theta_1 (\ddot{x} cos\theta_1 - gsin\theta_1) + m_2 cos\theta_2 (\ddot{x} cos\theta_2 - gsin\theta_2) - m_1 l_1 \dot{\theta}_1^2 sin\theta_1 - m_2 l_2 \dot{\theta}_2^2 sin\theta_2}{(M + m_1 + m_2)}$$
(35)

$$(M + m_1 + m_2)\ddot{x}$$

$$= F + m_1\ddot{x}cos\theta_1^2 - m_1gcos\theta_1sin\theta_1 + m_2\ddot{x}cos\theta_2^2$$

$$- m_2gcos\theta_2sin\theta_2(\ddot{x}cos\theta_2 - gsin\theta_2) - m_1l_1\dot{\theta}_1^2sin\theta_1$$

$$- m_2l_2\dot{\theta}_2^2sin\theta_2$$
(36)

$$(M + m_1 + m_2 - m_1 cos\theta_1^2 - m_2 cos\theta_2^2) \ddot{x} = F - m_1 g cos\theta_1 sin\theta_1 - m_2 g cos\theta_2 sin\theta_2 - m_1 l_1 \dot{\theta}_1^2 sin\theta_1 - m_2 l_2 \dot{\theta}_2^2 sin\theta_2$$
 (37)

Now,

$$\ddot{x} = \frac{1}{(M + m_1 + m_2 - m_1 cos\theta_1^2 - m_2 cos\theta_2^2)} [F - m_1 sin\theta_1 \Big[ gcos\theta_1 + l_1 \dot{\theta_1^2} \Big] - m_2 sin\theta_2 \Big[ gcos\theta_2 + l_2 \dot{\theta_2^2} \Big] (38)$$

Substituting equation (38) in (32)

$$\ddot{\theta_{1}} = \frac{1}{l_{1}} \left[ \frac{\left[F - m_{1} sin\theta_{1} \left[gcos\theta_{1} + l_{1}\dot{\theta_{1}^{2}}\right] - m_{2} sin\theta_{2} \left[gcos\theta_{2} + l_{2}\dot{\theta_{2}^{2}}\right]\right]}{(M + m_{1} sin\theta_{1}^{2} + m_{2} sin\theta_{2}^{2})} \left[ \frac{cos\theta_{1} - gsin\theta_{1}}{1} \right] \right]$$
(39)

Substituting equation (38) in (34)

$$\ddot{\theta_{2}} = \frac{1}{l_{2}} \left[ \frac{\left[F - m_{1} sin\theta_{1} \left[gcos\theta_{1} + l_{1}\dot{\theta_{1}^{2}}\right] - m_{2} sin\theta_{2} \left[gcos\theta_{2} + l_{2}\dot{\theta_{2}^{2}}\right]\right]}{(M + m_{1} sin\theta_{1}^{2} + m_{2} sin\theta_{2}^{2})} \left[\frac{cos\theta_{2} - gsin\theta_{2}}{1}\right]$$
(40)

Possible choice of state is:

$$X = \begin{bmatrix} x \\ \dot{x} \\ \theta_1 \\ \dot{\theta}_1 \\ \theta_2 \\ \dot{\theta}_2 \end{bmatrix} \tag{40}$$

Non-linear state space equation is:

$$\dot{X} = \begin{bmatrix} \dot{x} \\ \dot{\beta} \\ \dot{\theta}_1 \\ \dot{\theta}_2 \\ \dot{\theta}_2 \end{bmatrix} = \begin{bmatrix} \frac{\dot{x}}{(M+m_1sin\theta_1[gcos\theta_1 + l_1\dot{\theta}_1^2] - m_2sin\theta_2[gcos\theta_2 + l_2\dot{\theta}_2^2]}{(M+m_1sin\theta_1^2 + m_2sin\theta_2^2)} \\ \frac{1}{\theta_1} \\ \frac{1}{\theta_2} \left[ \frac{[F-m_1sin\theta_1[gcos\theta_1 + l_1\dot{\theta}_1^2] - m_2sin\theta_2[gcos\theta_2 + l_2\dot{\theta}_2^2]}{(M+m_1sin\theta_1^2 + m_2sin\theta_2^2)} \left[ \frac{cos\theta_1 - gsin\theta_1}{1} \right] \\ \frac{\dot{\theta}_2}{(M+m_1sin\theta_1^2 + m_2sin\theta_2^2)} \\ \frac{1}{\theta_2} \left[ \frac{[F-m_1sin\theta_1[gcos\theta_1 + l_1\dot{\theta}_1^2] - m_2sin\theta_2[gcos\theta_2 + l_2\dot{\theta}_2^2]}{(M+m_1sin\theta_1^2 + m_2sin\theta_2^2)} \left[ \frac{cos\theta_2 - gsin\theta_2}{1} \right] \right]$$

#### **CHAPTER - 3**

# LINEARIZING THE SYSTEM AROUND EQUILIBRIUM POINT AND LINEARIZED STATE SPACE REPRESENTATION

Dynamic equations derived above are non-linear and it needs to be linearized around an equilibrium point such that it can be tested for properties such as controllability and stabilizability. This equilibrium point has the property to remain at same state for the given input. The above equations can be linearized to Linear Time Invariant system.

Linearization around state variables is given by the Jacobian linearization matrix below:

J= $\partial F_1$  $\partial F_1$  $\partial F_1$  $\partial F_1$  $\overline{\partial \theta_1}$ дż  $\overline{\partial \dot{\theta_1}}$  $\partial \dot{\theta_2}$  $\partial \theta_2$  $\partial F_2$  $\frac{\partial F_2}{\partial \theta_1}$  $\frac{\partial F_2}{\partial \theta_2}$  $\partial F_2$  $\frac{\partial F_2}{\partial \dot{\theta_1}}$  $\partial F_2$ дх дż  $\partial \dot{\theta_2}$  $\partial F_3$  $\partial F_3$ дż  $\overline{\partial \theta_1}$  $\partial \dot{\theta_1}$  $\partial \dot{\theta_2}$ дх (42) $\partial F_4$  $\partial F_4$  $\partial F_{\underline{4}}$  $\partial F_4$  $\partial F_4$  $\overline{\partial \theta_1}$  $\overline{\partial \theta_2}$ дх дż  $\overline{\partial \dot{\theta_1}}$  $\partial \dot{\theta_2}$  $\frac{\partial F_5}{\partial \dot{\theta_1}}$  $\frac{\partial F_5}{\partial \theta_2}$  $\partial F_5$ дх дż

The state space representation of linearized system is,

$$\dot{X} = AX(t) + BU(t)$$

$$\dot{X} = \begin{bmatrix} \dot{x} \\ \ddot{x} \\ \dot{\theta}_1 \\ \dot{\theta}_2 \\ \ddot{\theta}_2 \end{bmatrix} = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{-gm_1}{M} & 0 & \frac{-gm_2}{M} & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & -\frac{g + \frac{gm_1}{M}}{M} & 0 & \frac{-gm_2}{Ml_1} & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & \frac{-gm_1}{Ml_2} & 0 & -\frac{g + \frac{gm_2}{M}}{l_2} & 0 \end{bmatrix} X(t) + \begin{bmatrix} 0 \\ \frac{1}{M} \\ 0 \\ \frac{1}{Ml_1} \\ 0 \\ \frac{1}{Ml_1} \end{bmatrix} U(t) \tag{43}$$

The matrix obtained by Jacobian linearization is A,

Where A and B are given by,

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & -gm_1 & 0 & -gm_2 & 0 \\ 0 & 0 & \frac{-gm_1}{M} & 0 & \frac{-gm_2}{M} & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & -\frac{g + \frac{gm_1}{M}}{l_1} & 0 & \frac{-gm_2}{Ml_1} & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & \frac{-gm_1}{Ml_2} & 0 & -\frac{g + \frac{gm_2}{M}}{l_2} & 0 \end{bmatrix}$$

$$(44)$$

$$B = \begin{bmatrix} 0\\ \frac{1}{M}\\ 0\\ 1\\ \frac{1}{Ml_1}\\ 0\\ \frac{1}{Ml_1} \end{bmatrix}$$
(45)

#### **CHAPTER - 4**

#### CONTROLLABILITY

#### 4.1 Conditions for linearized system to be controllable:

A linear state equation is called controllable on the finite time interval [t<sub>0</sub>, t<sub>f</sub>] if a continuous input signal U(t) can drive the system from initial state  $X(t_0) = X_0$  to origin  $X(t_f) = 0$ . A pair (A, B) is said to be controllable if the grammian of controllability  $W_c$  is invertible.

Determinant of controllability matrix:4

$$|C| = \frac{g^6 l_1^2 - 2g^6 l_1 l_2 + g^6 l_2^2}{M^6 l_1^6 l_2^6}$$
(46)

$$rank = ([B_k \ AB_k \ A^2B_k \ \cdots \ A^{n-1}B_k])_{n*nm} = n$$
 (47)

$$\Rightarrow \frac{g^6 l_1^2 - 2g^6 l_1 l_2 + g^6 l_2^2}{M^6 l_1^6 l_2^6} \neq 0 \tag{48}$$

$$\Rightarrow g^6 l_1^2 - 2g^6 l_1 l_2 + g^6 l_2^2 \neq 0 \tag{49}$$

$$\Rightarrow (g^3 l_1 - g^3 l_2)^2 \neq 0 \tag{50}$$

$$\Rightarrow (g^3 l_1)^2 \neq g^3 l_2 \tag{51}$$

$$\Rightarrow l_1 \neq l_2 \tag{52}$$

Equation (52) is the condition for the system to be controllable.

#### **CHAPTER - 5**

#### LQR CONTROLLER

#### **5.1 Test for controllability:**

Controllability is the existence of a control input(U) such that in the absence of disturbances the systems state changes from initial state to desired state at any time instant. Controllability of a pair  $(A, B_k)$  can be verified by finding the rank of controllability matrix which is given as

$$rank = ([B_k \quad AB_k \quad A^2B_k \quad \cdots \quad A^{n-1}B_k])_{n*nm} = n$$

#### 5.2 Linear Quadratic Regulator (LQR) control

If the pair  $(A, B_k)$  is stabilizable, the cost function of linear Quadratic Regulator is given by

$$J(K, X_0) = \int_0^\infty X^T(t)QX(t) + U_k(t)RU_K dt$$

The cost function is minimized using the control input U and a regulating matrix R and a matrix Q that imposes cost which is applied to linear system.

Where the gain can be found from the equation  $-R^{-1}B^TP$ , Where P is a solution of Riccati equation  $A^TP + PA - PBR^{-1}B^TP = -Q$ . Q is positive definite and symmetric.

If Q >> R, then the states converge to desired state faster than the system with Q << R.

## CHECK FOR OBSERVABILITY FOR GIVEN STATE VARIABLES

The linear state equation is said to be observable on the interval  $[t_0, t_f]$  if any initial state  $x(t_0) = x_0$  is uniquely determined by the corresponding response y(t), where  $t \in [[t_0, t_f]]$

#### CHAPTER – 7

#### **LUENBERGER OBSERVER**

Luenberger observer is given by following state space representation

$$\dot{\vec{X}}(t) = \mathbf{A}\dot{\vec{X}}(t) + \mathbf{B}_K \vec{U}_K(t) + \mathbf{L}(\vec{Y}(t) - \mathbf{C}\dot{\vec{X}}(t)), \quad \vec{X}(0) = 0$$

Where L=observer gain matrix and Y(t) - CX(t) = correction term

The Luenberger observer gain matrix can be obtained by placing the poles of  $A^T$ ,  $C^T$ . The poles are generally 3 times larger than the present position of poles. Here, we have taken 10 times larger poles. The gain matrices for the observers will be high in our case.

### CHAPTER - 8

# **LQG CONTROLLER**

### 8.1 LQG Controller for Linear Model

The LQG controller is a combination of a Kalman filter with a linear quadratic regulator (LQR). According to the separation principle the state estimator and state feedback can be designed independently. The structure of the optimal solution is given by standard output feedback configuration with the Luenberger observer with optimal K and L are computed separately using LQR and Kalman-Bucy method. The LQG method in MATLAB takes the weighted process noise and measurement noise as inputs and outputs the required state space form of the system. Note that, every-time we run the LQG controller code, the response of the system is different as the noise terms differ due to the white gaussian noise. The wgn function requires communication toolbox.

### CHAPTER – 9

#### ASSUMPTIONS

- The cart has no friction between the ground and the wheels.
- The motion is along one direction.
- The poles for the Luenberger observer are placed far away from the systems' poles.
- The code is provided with comments wherever it is thought as necessary to understand.
- The plots for the non-linear system simulations constitute of the estimations instead of the error in the state variables.
- Since the simulation is taking long time, the time for non-linear system is given with 2000 seconds.
- One can observe that the estimates are also damping, which means that the system will reach equilibrium point if given more time.
- The acceleration due to gravity is assumed to be 9.8 m/s.
- There is no collision between the two loads.
- The length of the strings doesn't change with the time and tension in the string.
- The state variables are taken from the figure 1 and are self-explanatory.
- Since our side goal is to look at the linearized system response for large values of initial conditions, the initial state is given with values that are far from the origin (equilibrium point).

### **CHAPTER - 10**

#### **CONCLUSION**

The given set of problems were successfully implemented using MATLAB. The LQG controller takes the noise terms to output a system. Hence, when a constant disturbance is applied on the input, that disturbance can be modelled as an external disturbance and LQG controller design can reject it. To address the tracking of constant reference, the state equation of the system can be modelled with a term and the same system can be used to track the reference. The other way of tracking a reference is to introduce a new state variable, which is an integral term of the error in the LQR controller state equation. The resultant controller is also called as Linear Quadratic Integral (LQI controller). The github code for the project can be found here.

## **CHAPTER - 11**

### **FUTURE SCOPE**

- The Q and R matrices of LQR controller can be tuned more extensively to get optimal response of the system.
- The response of the non-linear system for the given initial states can be studied more.
- Since we are looking at estimates, the error can also be plotted to get the response of the non-linear model.
- We would also like to analyze the Luenberger observer gain matrices for different pole placements.
